

Project Design Phase-II
Solution Requirements (Functional & Non-functional)

Date	29.9.2026
Team ID	SWTID-2026-6203
Project Name	Script Controlled ACL – Restrict Record Access Based on Field Value

Functional Requirements:

Following are the functional requirements of the proposed solution.

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	Script Controlled ACL Configuration	Administrator can create and configure an ACL for a record.
		Administrator can select the field value and define the access condition.
FR-2	Field-Based Record Access	System can check the specified field value before granting access.
		Matching field value allows the user to access the record.
FR-3	Access Restriction	Non-matching field value must deny access to the record.
		Unauthorized users must not be able to view restricted records.
FR-4	User & Record Validation	System can evaluate the current user and requested record.
		ACL works consistently for different users and records.
FR-5	Testing & Maintenance	Administrator can test the ACL using authorized and unauthorized users.
		Administrator can update the field-based condition when requirements change.

Non-functional Requirements:

Following are the non-functional requirements of the proposed solution.

NFR No.	Non-Functional Requirement	Description
NFR-1	Usability	The solution should provide simple and clear access behaviour for administrators and users.
NFR-2	Security	The ACL must prevent unauthorized record access and enforce field-based security conditions.
NFR-3	Reliability	The system should consistently allow or deny access according to the configured field value.
NFR-4	Performance	Access checks should execute quickly without noticeable delay during record access.
NFR-5	Availability	The access-control mechanism should remain available whenever users request protected records.
NFR-6	Scalability	The design should support increasing numbers of users, records, and field-based access rules.
