

Coding & Solution

Date	30 September 2026
Team ID	SWTID-2026-6203
Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value

Coding & Solution

This section describes the implementation of a script-controlled Access Control List (ACL) in ServiceNow. The solution restricts record access based on a specified field value and user roles. The project implements READ, CREATE, WRITE and DELETE ACLs to provide controlled and secure access to records.

Instructions:

1. Create the required test user and custom roles in ServiceNow.
2. Create the Institution Details custom table and add the required fields.
3. Configure READ, CREATE, WRITE and DELETE ACLs with the appropriate roles.
4. Use the ACL script to control access based on the branch field and verify the permissions by impersonating users.

Solution Summary

Field	Details
Repository Link / URL	Not provided in the project documentation.
Programming Language(s)	JavaScript (ServiceNow ACL scripting)
Framework(s) Used	ServiceNow
Key Features Implemented	Script-controlled READ, CREATE, WRITE and DELETE ACLs; role-based access using bb1, bb2, bb3 and bb4; field-based restriction for EEE branch records; administrator full access.
Pending / Incomplete Features	None specified in the supplied project documentation.
Setup / Run Instructions	Log in with admin access → create user and roles → create Institution Details table → add fields → create ACLs → impersonate users → verify access permissions.

Code Quality Checklist

S.No	Criteria	Status (Yes / No)
1	Code is modular and organized into functions / classes	Yes
2	Meaningful variable and function names are used	Yes
3	Code includes comments / documentation where necessary	Yes
4	Error handling is implemented for critical operations	Not Specified
5	The application runs without critical errors	Yes
6	Code is committed to a version control repository	Not Specified

Project Implementation Summary

The project creates the Institution Details table with Student Roll Number, Student Name, Faculty Name, Branch, Email, Phone Number and Description fields. The READ ACL uses the bb1 role and a script to control record visibility. CREATE, WRITE and DELETE ACLs use bb2, bb3 and bb4 respectively. The project verifies that access is controlled according to the assigned roles.

Verification

- User with bb1 role can view EEE branch records.
- User with bb1 and bb2 roles can create records.
- User with bb1, bb2 and bb3 roles can view and edit EEE branch records.
- User with bb1, bb2, bb3 and bb4 roles can view, create, edit and delete EEE branch records.
- Admin user can view all records regardless of branch.
