

Project Design Phase
Proposed Solution Template

Date	30.9.2026
Team ID	SWTID-2026-6203
Project Name	Script Controlled ACL – Restrict Record Access Based on Field Value

Proposed Solution Template:

Project team shall fill the following information in the proposed solution template.

S.No	Parameter	Description
1	Problem Statement (Problem to be solved)	In many applications, users should not be able to access every record. Existing access rules may provide only broad role-based control and may not restrict records dynamically according to a specific field value. This can lead to unauthorized record visibility and reduced data security.
2	Idea / Solution Description	Develop a Script Controlled Access Control List (ACL) that evaluates a selected field value before allowing record access. The ACL script checks the configured condition and grants access only when the field value satisfies the required rule; otherwise, access is denied.
3	Novelty / Uniqueness	The solution provides dynamic record-level access control based on field values rather than depending only on fixed roles. A server-side ACL script evaluates each record's field value and applies the access decision automatically, making the control flexible and reusable.
4	Social Impact / Customer Satisfaction	The solution improves data privacy and security by preventing unauthorized users from viewing restricted records. It helps administrators enforce business-specific access rules consistently, reduces the risk of accidental data exposure, and increases confidence in the application's record access controls.
