

Problem-Solution Fit

Date	30.9.2026
Team ID	SWTID-2026-6203
Project Name	Script Controlled ACL – Restrict Record Access Based on Field Value

Problem-Solution Fit Canvas:

The canvas identifies the target users, access-control problems, existing approaches, root causes, user behaviour, limitations and the proposed field-based ACL solution.

1. CUSTOMER SEGMENT(S) [CS] ServiceNow administrators and application developers who manage sensitive records.	6. CUSTOMER LIMITATIONS [CL] Basic access rules may not be sufficient when record access depends on a particular field value.	5. AVAILABLE SOLUTIONS [AS] Role-based ACLs and basic access rules. They provide security but may not directly support field-value-based restrictions.
2. PROBLEMS / PAINS [PR] Users may access records that should be restricted based on a field value. This can occur whenever records have different access conditions.	9. PROBLEM ROOT / CAUSE [RC] Access rules may not dynamically evaluate the required field condition before allowing record access.	7. BEHAVIOR + ITS INTENSITY [BE] Administrators configure and test ACL rules. Incorrect conditions can result in unwanted record visibility.
3. TRIGGERS TO ACT [TR] Need to protect sensitive records and allow access only when the required field value satisfies the defined condition.	10. YOUR SOLUTION [SI] Script Controlled ACL – Restrict Record Access Based on Field Value A scripted ACL checks a selected field value and grants or denies record access according to the configured condition.	8. CHANNELS OF BEHAVIOR [CH] ONLINE ServiceNow application / web interface OFFLINE ACL configuration and testing
4. EMOTIONS BEFORE / AFTER [EM] Before: Concern about unauthorized record access. After: Greater confidence that records are protected according to field-based conditions.
