

Brainstorming & Idea Prioritization Template

Date	29 September 2026
Team ID	SWTID-2026-6203
Project Name	Script Controlled ACL – Restrict Record Access Based on Field Value

Step 1: Brainstorm and Idea Listing

The team discussed different approaches for restricting record access based on field values using Access Control Lists (ACLs) and scripting. Ideas were grouped according to security, record access, user experience, and technical implementation.

S.No	Team Member	Idea / Suggestion	Category	Group No.
1	R.Megha Shree	Role-based record access control	Authentication & Security	1
2	C.Manoranjitham	User-specific record restriction	Authentication & Security	1
3	M.Manjula	Field-value based record access	Core Record Access	2
4	P.Nisha	Script-controlled ACL validation	Technical	3
5	P.Sivabharathy	Restrict unauthorized records	Core Record Access	2
6	R.Megha Shree	Testing with multiple users and records	Technical	3

Step 2: Idea Prioritization

Ideas were considered based on feasibility within the deadline, learning value, practical real-world use, security requirements, and technical complexity.

Group No.	Final Idea	Feasibility (High/Medium/Low)	Importance (High/Medium/Low)	Priority	Selected (Yes/No)
1	Script-controlled ACL and user-specific validation	High	High	High	Yes
2	Field-value based record access and record-level security	High	High	High	Yes
3	ACL configuration with server-side scripting and access testing	High	High	High	Yes

Step 3: Idea Prioritization Summary

Priority	Selected / Planned Ideas	Status
High Priority	Script-controlled ACL; field-value based record access; user-specific record validation; allow/deny access based on condition; record-level security testing	Implemented Features
Medium Priority	Multiple field conditions; department-wise access rules; improved error or access-denied messages	Enhancements
Low Priority / Future Scope	Advanced role and field combinations; audit and access logging; dynamic security rules for multiple tables; centralized security administration	Future Scope

Final Decision

The team finalized Script Controlled ACL – Restrict Record Access Based on Field Value as the project solution. The solution provides practical learning in access control, server-side scripting, field-based authorization, and record-level security.
