

Script Controlled ACL – Restrict Record Access Based on Field Value
Ideation Phase
Empathize & Discover

Date	29.9.2026
Team ID	SWTID-2026-6203
Project Name	Script Controlled ACL – Restrict Record Access Based on Field Value

Empathy Map Canvas

An empathy map is a simple visual tool used to understand a user's behaviour, needs, thoughts, and feelings. For this project, the empathy map helps the team understand the experience of users who need secure access to records based on field values.

Understanding the user's perspective helps identify problems with unauthorized record access and guides the design of a practical Script Controlled ACL solution.

Example User: System Administrator / Department Manager

SAYS "I need secure access control for records." "Users should only see records they are allowed to access."	THINKS "Which field should control access?" "How can I prevent unauthorized record visibility?"
DOES Checks user permissions. Configures ACL rules. Tests access using different users and records.	FEELS Concerned about unauthorized access. Wants a secure and reliable solution. Feels confident when access rules work correctly.

Reference / Source: Empathy Map Canvas concept adapted to the project context.

Empathy Map – Detailed User Insights

Area	User Insight	Project Relevance
Says	"I want users to access only the records relevant to them." "The access rule should be automatic."	Shows the need for field-based and dynamic access control.
Thinks	"Can a field value decide whether a record is accessible?" "How can I reduce manual permission management?"	Supports the use of a scripted ACL that evaluates field values.
Does	Creates records, assigns field values, configures ACLs, and tests records with different users.	Helps define the ACL conditions and testing scenarios.
Feels	Concerned when unauthorized users can view records; relieved when the restriction works correctly.	Emphasizes security, reliability, and clear access behaviour.
Pains	Unauthorized record visibility, complicated access rules, repeated manual checking, and security concerns.	Identifies the main problems that the project should solve.
Gains	Automatic record restriction, easier administration, secure field-based access, and predictable user permissions.	Defines the expected benefits of the Script Controlled ACL.

Key Findings

1. Users need record access to be controlled according to relevant field values.
2. Manual permission management can become difficult as the number of records and users increases.
3. A scripted ACL can evaluate the field value and make an access decision dynamically.
4. The solution should be tested with both authorized and unauthorized users.

Empathy Conclusion: The user's main need is a secure and simple way to ensure that only authorized records are visible. These insights support the proposed Script Controlled ACL solution.
